Art Unit: 2617

Amendments to the Claims

This listing of claims will replace all prior versions and listing of claims in the

application.

1. (Currently Amended) A method for measuring usage of media data received at a user

location, the media data being reproducible as comprehensible images or comprehensible sounds

and having ancillary codes in at least some of the media data, comprising:

receiving the media data in a monitoring device at the user location;

forming a data set in the monitoring device from the media data by including in the data

set, data sufficient to decode the ancillary codes in the media data or to form a signature to

identify the media data, while excluding from the data set, data required either to reproduce the

comprehensible images or the comprehensible sounds;

communicating the data set to a processing system located remotely from the user

location; and

at the remotely located processing system, carrying out at least one of:

processing the data set to detect decode the ancillary codes; and

producing a signature characterizing the media data based on the data set and matching

the produced signature with a reference signature associated with identification data for the

media data.

2. (Original) A method according to Claim 1, wherein forming a data set comprises

transforming at least a portion of the received media data into frequency-domain data.

1 NO.: 09/890,240

Art Unit: 2617

3. (Original) The method of Claim 2, wherein forming a data set comprises producing

amplitude data for each of a plurality of frequency ranges of the frequency-domain data, each

frequency range corresponding to a predetermined component of the ancillary codes.

4. (Original) The method of Claim 3, wherein the amplitude data are each formed as a

ratio of amplitude data in a corresponding frequency range to a noise level based on amplitude

data outside such corresponding frequency range.

5. (Original) The method of Claim 1, wherein the data set comprises data representing

time-domain information.

6. (Original) The method of Claim 5, wherein the time-domain data comprises data

from a frequency range narrower than a frequency range of the media data.

7. (Original) The method of Claim 1, wherein the data set comprises data representing

phase information.

8. (Original) The method of Claim 1, wherein the media data comprises audio data.

9. (Original) The method of Claim 1, wherein the media data comprises video data.

10. (Original) The method of Claim 1, wherein the media data is received as acoustic

energy.

11. (Original) The method of Claim 1, wherein the media data is received as

electromagnetic energy.

12. (Original) The method of Claim 11, wherein the media data is received as light

energy.

Art Unit: 2617

13. (Original) The method of Claim 1, wherein the media data is received as magnetic

energy.

14. (Original) The method of Claim 1, wherein the media data is received as electrical

energy.

15. (Currently Amended) The method of Claim 1, wherein processing the data set to

detect decode the ancillary codes comprises processing frequency-domain data.

16. (Currently Amended) The method of Claim 15, wherein the frequency-domain

data is processed to detect decode components of the ancillary codes at predetermined

frequencies.

17. (Currently Amended) The method of Claim 15, wherein the frequency-domain

data is processed to detect decode code components of the ancillary codes distributed according

to a frequency-hopping pattern.

18. (Original) The method of Claim 17, wherein the code components comprise pairs of

frequency components modified in amplitude to encode information.

19. (Original) The method of Claim 17, wherein the code components comprise pairs of

frequency components modified in phase to encode information.

20. (Currently Amended) The method of Claim 1, wherein processing the data set to

detect decode the ancillary codes comprises detecting a spread spectrum code.

21. (Original) The method of Claim 1, wherein receiving media data comprises receiving

media data in a portable monitoring device carryable on the person of a user.

Attorney Ref: 25896.247/P0043A

Appln. Serial No.: 09/896,246

Art Unit: 2617

22. (Currently Amended) A system for measuring usage of media data received at a

user location, the media data being reproducible as comprehensible images or comprehensible

sounds and having ancillary codes in at least some of the media data, comprising:

a monitoring device at the user location and having an input to receive the media

data;

a first processor at the user location coupled with the monitoring device to receive

the media data and operative to form a data set including data sufficient to decode the ancillary

codes in the media data or to form a signature to identify the media data, while excluding from

the data set, data required either to reproduce the comprehensible images or the comprehensible

sounds;

a first communications device coupled with the first processor to receive the data

set and operative to communicate the data set to a processing system located remotely from the

user location;

a second communications device at the processing system coupled with the first

communications device to receive the data set; and

a second processor at the processing system and having an input coupled with the

second communications device to receive the data set received by the second communications

device, the second processor being operative to carry out at least one of:

processing the data set to detect decode the ancillary codes; and (a)

producing a signature characterizing the media data based on the data set (b)

and matching the produced signature with a reference signature associated with identification

data for the media data.

Art Unit: 2617

23. (Original) The system of Claim 22, wherein the first processor is operative to form

the data set by transforming at least a portion of the received media data into frequency-domain

data.

24. (Original) The system of Claim 23, wherein the processor is operative to produce

amplitude data for each of a plurality of frequency ranges of the frequency-domain data, each

frequency range corresponding to a predetermined component of the ancillary codes.

25. (Original) The system of Claim 24, wherein the processor is operative to form each

of the amplitude data as a ratio of amplitude data in a corresponding frequency range to a noise

level based on amplitude data outside such corresponding frequency range.

26. (Original) The system of Claim 22, wherein the monitoring device comprises a

portable monitoring device carryable on the person of a user.

27. (Original) The system of Claim 22, wherein the first processor is operative to include

time-domain data in the data set.

28. (Original) The system of Claim 27, wherein the time-domain data comprises data

from a frequency range narrower than a frequency range of the media data.

29. (Original) The system of Claim 22, wherein the first processor is operative to include

data representing phase information in the data set.

30. (Original) The system of Claim 22, wherein the monitoring device is operative to

receive the media data as acoustic energy.

31. (Original) The system of Claim 22, wherein the monitoring device is operative to

receive the media data as electromagnetic energy.

Art Unit: 2617

32. (Original) The system of Claim 31, wherein the monitoring device is operative to

receive the media data as light energy.

33. (Original) The system of Claim 22, wherein the monitoring device is operative to

receive the media data as magnetic energy.

34. (Original) The system of Claim 22, wherein the monitoring device is operative to

receive the media data as electrical energy.

35. (Currently Amended) The system of Claim 22, wherein the second processor is

operative to process the frequency-domain data to detect decode the ancillary codes.

36. (Currently Amended) The system of Claim 35, wherein the second processor is

operative to process the frequency-domain data by detecting components of the ancillary codes

at predetermined frequencies to detect decode the ancillary codes.

37. (Currently Amended) The system of Claim 35, wherein the second processor is

operative to process the frequency-domain data to detect decode code components distributed

according to a frequency-hopping pattern.

38. (Currently Amended) The system of Claim 37, wherein the second processor is

operative to detect decode the ancillary codes by detecting pairs of frequency components

modified in amplitude to encode information.

39. (Currently Amended) The system of Claim 37, wherein the second processor is

operative to detect decode the ancillary codes by detecting pairs of frequency components

modified in phase to encode identification information.

Art Unit: 2617

40. (Currently Amended) The system of Claim 22, wherein the second processor is

operative to detect decode the ancillary codes in the form of spread spectrum codes.

A system for measuring usage of media data received at a 41. (Currently Amended)

user location, the media data being reproducible as comprehensible images or comprehensible

sounds and having ancillary codes in at least some of the media data, comprising:

a communications device at a processing facility located remotely from a user

location, the communications device having an input to receive a data set including data

sufficient to decode the ancillary codes in the media data or to form a signature to identify the

media data, while excluding data required to either reproduce the comprehensible images or the

comprehensible sounds; and

a processor located at the processing facility and coupled with the

communications device to receive the data set and operative to carry out at least one of:

processing the data set to detect decode the ancillary codes; and (a)

producing a signature characterizing the media data based on the data set (b)

and matching the produced signature with a reference signature associated with identification

data for the media data.

42. (Currently Amended) The system of Claim 41, wherein the processor is operative

to detect decode the ancillary codes by processing frequency-domain data.

43. (Currently Amended) The system of Claim 42, wherein the processor is operative

to detect components of the ancillary codes at predetermined frequencies to detect decode the

ancillary codes.

Art Unit: 2617

44. (Currently Amended) The system of Claim 42, wherein the processor is operative

to detect decode components of the ancillary codes distributed according to a frequency-hopping

pattern.

45. (Currently Amended) The system of Claim 44, wherein the processor is operative

to detect decode pairs of ancillary code frequency components modified in amplitude to encode

information.

46. (Currently Amended) The system of Claim 44, wherein the processor is operative

to detect decode pairs of ancillary code frequency components modified in phase to encode

information.

47. (Currently Amended) The system of Claim 41, wherein the processor is operative

to detect decode the ancillary codes in the form of spread spectrum codes.

48. (Currently Amended) A system for measuring usage of media data received at a

user location, the media data being reproducible as comprehensible images or comprehensible

sounds and having ancillary codes in at least some of the media data, comprising:

means for receiving the media data at the user location;

means at the user location for forming a data set from the media data by including

in the data set, data sufficient to decode the ancillary codes in the media data or to form a

signature to identify the media data, while excluding from the data set, data required either to

reproduce the comprehensible images or the comprehensible sounds;

means for communicating the data set to a processing system located remotely

from the user location; and

Art Unit: 2617

processing means at the processing system for carrying out at least one of:

(a) processing the data set to detect decode the ancillary codes; and

(b) producing a signature characterizing the media data based on the data set

and matching the produced signature with a reference signature associated with identification

data for the media data.

49. (Original) The system of Claim 48, wherein the means for forming a data set is

operative to transform at least a portion of the received media data into frequency-domain data.

50. (Original) The system of Claim 49, wherein the means for forming a data set is

operative to produce amplitude data for each of a plurality of frequency ranges of the frequency-

domain data, each frequency range corresponding to a predetermined component of the ancillary

codes.

51. (Original) The system of Claim 50, wherein the means for forming a data set is

operative to form each of the amplitude data as a ratio of amplitude data in a corresponding

frequency range to a noise level based on amplitude data outside such corresponding frequency

range.

52. (Original) The system of Claim 48, wherein the means for forming the data set is

operative to include data representing time-domain information therein.

53. (Original) The system of Claim 52, wherein the means for forming a data set is

operative to select the time-domain data from a frequency range narrower than a frequency range

of the media data.

Art Unit: 2617

54. (Original) The system of Claim 48, wherein the means for forming a data set is

operative to include data representing phase information therein.

55. (Original) The system of Claim 48, wherein the means for receiving media data is

operative to receive the media data as acoustic energy.

56. (Original) The system of Claim 48, wherein the means for receiving media data is

operative to receive the media data as electromagnetic energy.

57. (Original) The system of Claim 56, wherein the means for receiving media data is

operative to receive the media data as light energy.

58. (Original) The system of Claim 48, wherein the means for receiving media data is

operative to receive the media data as magnetic energy.

59. (Original) The system of Claim 48, wherein the means for receiving media data is

operative to receive the media data as electrical energy.

60. (Original) The system of Claim 48, wherein the processing means is operative to

process frequency-domain data to detect decode the ancillary codes.

61. (Currently Amended) The system of Claim 60, wherein the processing means is

operative to detect components of the ancillary codes at predetermined frequencies to detect

decode the ancillary codes.

The system of Claim 60, wherein the processing means is 62. (Currently Amended)

operative to detect code components distributed according to a frequency-hopping pattern to

detect decode the ancillary codes.

Art Unit: 2617

The system of Claim 62, wherein the processing means is 63. (Currently Amended)

operative to detect decode the ancillary codes by detecting pairs of frequency components

modified in amplitude to encode information.

The system of Claim 62, wherein the processing means is 64. (Currently Amended)

operative to detect decode the ancillary codes by detecting pairs of frequency components

modified in phase to encode information.

65. (Currently Amended) The system of Claim 48, wherein the processing means is

operative to detect decode a spread spectrum code as the ancillary code.

66. (Original) The system of Claim 48, wherein the means for receiving the media data

comprises a portable monitoring device carryable on the person of an audience member.

A system for measuring usage of media data received at a 67. (Currently Amended)

user location, the media data being reproducible as comprehensible images or comprehensible

sounds and having ancillary codes in at least some of the media data, comprising:

means for receiving a data set at a processing system located remotely from the

user location, the data set including data sufficient to decode the ancillary codes in the media

data or to form a signature characterizing the media data, while excluding data required either to

reproduce the comprehensible images or the comprehensible sounds; and

processing means located at the processing system for carrying out at least one of:

(a) processing the data set to detect decode the ancillary codes; and

Art Unit: 2617

(b) producing a signature characterizing the media data and matching the

produced signature with a reference signature associated with identification data for the media

data.

68. (Currently Amended) The system of Claim 67, wherein the processing means

comprises means for processing frequency-domain data to detect decode the ancillary codes.

69. (Currently Amended) The system of Claim 68, wherein the processing means is

operative to process the frequency-domain data to detect decode components of the ancillary

codes at predetermined frequencies.

70. (Currently Amended) The system of Claim 68, wherein the processing means is

operative to process the frequency-domain data to detect decode components of the ancillary

codes distributed according to a frequency-hopping pattern.

71. (Currently Amended) The system of Claim 70, wherein the processing means is

operative to detect decode pairs of ancillary code frequency components modified in amplitude

to encode information.

72. (Currently Amended) The system of Claim 70, wherein the processing means is

operative to detect decode pairs of ancillary code frequency components modified in phase to

encode information.

73. (Currently Amended) The system of Claim 67, wherein the processing means is

operative to detect decode the ancillary codes in the form of spread spectrum codes.

74. (Currently Amended) A method for measuring usage of media data received at a

user location, the media data being reproducible as comprehensible images or comprehensible

sounds and having ancillary codes in at least some of the media data, comprising:

receiving a data set at a processing system located remotely from the user location, the data set including data sufficient to decode the ancillary codes in the media data or to form a signature to identify the media data, while excluding data required either to reproduce

the comprehensible images or the comprehensible sounds; and

at the remotely located processing system, carrying out at least one of

- (a) processing the data set to detect decode the ancillary codes; and
- (b) producing a signature characterizing the media data and matching the produced signature with a reference signature associated with identification data for the media data.
- 75. (Currently Amended) The method of Claim 74, wherein processing the data set to detect decode the ancillary codes comprises processing frequency-domain data.
- 76. (Currently Amended) The method of Claim 75, wherein the frequency-domain data is processed to detect decode components of the ancillary codes at predetermined frequencies.
- 77. (Currently Amended) The method of Claim 75, wherein the frequency-domain data is processed to detect decode components of the ancillary codes distributed according to a frequency-hopping pattern.
- 78. (Original) The method of Claim 77, wherein the code components comprise pairs of frequency components modified in amplitude to encode information.
- 79. (Original) The method of Claim 77, wherein the code components comprise pairs of frequency components modified in phase to encode information.

Art Unit: 2617

The method of Claim 74, wherein processing the data set to 80. (Currently Amended)

detect decode the ancillary codes comprises detecting a spread spectrum code.

A method for measuring usage of media data received at a 81. (Currently Amended)

user location, comprising:

receiving media data representing information in a monitoring device at the user

location;

forming a data set in the monitoring device representing some, but not all, of the

information represented by the media data;

communicating the data set to a processing system located remotely from the user

location; and

at the processing system, carrying out at least one of:

processing the data set to detect decode an ancillary code for the media (a)

data; and

obtaining identification data for the media data by producing a signature (b)

for the media data based on the data set and matching the produced signature with a reference

signature associated with the identification data.

82. (Original) The method of claim 81 wherein forming a data set comprises

transforming at least a portion of the received media data into frequency-domain data.

83. (Original) The method of claim 82, wherein forming a data set comprises producing

amplitude data for each of a plurality of frequency ranges of the frequency-domain data, each

frequency range corresponding to a predetermined code component.

Art Unit: 2617

84. (Original) The method of claim 83, wherein the amplitude data are each formed as a

ratio of amplitude data in a corresponding frequency range to a noise level based on amplitude

data outside such corresponding frequency range.

85. (Original) The method of claim 81, wherein receiving media data comprises

receiving media data in a portable monitoring device carryable on the person of a user.

86. (Previously presented) The method of claim 81, wherein processing the data set

comprises processing frequency-domain data.

87. (Currently Amended) The method of claim 86, wherein the frequency-domain

data is processed to detect decode components of the identification code at predetermined

frequencies.

88. (Currently Amended) A method for measuring usage of media data representing

information and received at a user location, comprising:

receiving a data set at a processing system located remotely from the user

location, the data set representing some, but not all, of the information represented by the media

data; and

at the processing system, carrying out at least one of:

(a) processing the data set to detect decode an ancillary code for the media

data; and

(b) obtaining identification data for the media data by producing a signature

for the media data based on the data set and matching the produced signature with a reference

signature associated with the identification data.

Art Unit: 2617

89. (Previously presented) The method of Claim 88, wherein processing the data set

comprises processing frequency-domain data.

The method of Claim 89, wherein the frequency-domain 90. (Currently Amended)

data is processed to detect decode components of the identification code at predetermined

frequencies.

A system for measuring usage of media data representing 91. (Currently Amended)

information received at a user location, comprising:

means for receiving a data set at a processing system located remotely from the

user location, the data set representing some, but not all, of the information represented by the

media data; and

processing means located at the processing system, for carrying out at least one

of:

processing the data set to detect decode an ancillary code for the media (a)

data; and

(b) obtaining identification data for the media data by producing a signature

for the media data based on the data set and matching the produced signature with a reference

signature associated with the identification data.

The system of Claim 91, wherein the processing means is 92. (Currently Amended)

operative to process frequency-domain data to detect decode the identification code.

Art Unit: 2617

93. (Currently Amended) The system of Claim 92, wherein the processing means is

operative to process the frequency-domain data to detect decode components of the identification

code at predetermined frequencies.

94. (Currently Amended) A system for measuring usage of media data received at a

user location, comprising:

means for receiving media data representing information at the user location;

data set forming means at the user location for forming a data set representing

some, but not all, of the information represented by the media data;

means for communicating the data set to a processing system located remotely

from the user location; and

processor means at the processing system, for carrying out at least one of:

(a) processing the data set to detect decode an ancillary code for the media

data; and

(b) obtaining identification data for the media data by producing a signature

for the media data based on the media data and matching the produced signature with a reference

signature associated with the identification data.

95. (Original) The system of Claim 94, wherein the data set forming means is operative

to form the data set by transforming at least a portion of the received media data into frequency-

domain data.

96. (Original) The system of Claim 95, wherein the data set forming means is operative

to transform at least a portion of the received media data by producing amplitude data for each of

Art Unit: 2617

a plurality of frequency ranges of the frequency-domain data, each frequency range

corresponding to a predetermined code component.

97. (Original) The system of Claim 96, wherein the data set forming means is operative

to form the amplitude data each as a ratio of amplitude data in a corresponding frequency range

to a noise level based on amplitude data outside such corresponding frequency range.

98. (Original) The system of Claim 97, wherein the means for receiving media data

comprises a portable device carryable on the person of a user.

99. (Currently Amended) The system of Claim 94, wherein the processor means is

operative to detect decode the identification code by processing frequency-domain data.

100. (Currently Amended) The system of Claim 99, wherein the processor means is

operative to process the frequency-domain data to detect decode components of the identification

code at predetermined frequencies.

101. (Currently Amended) A system for measuring usage of media data representing

information received at a user location, comprising:

a communications device at a processing facility located remotely from the user

location having an input to receive a data set representing some, but not all, of the information

represented by the media data; and

a processor located at the processing facility and coupled with the

communications device to receive the data set and operative to carry out at least one of:

(a) processing the data set to detect decode an ancillary code for the media

data; and

Art Unit: 2617

(b) obtaining identification data for the media data by producing a signature

for the media data based on the data set and matching the produced signature with a reference

signature associated with the identification data.

102. (Currently Amended) The system of Claim 101, wherein the processor is

operative to detect decode the identification code by processing frequency-domain data.

103. (Currently Amended) The system of Claim 101, wherein the processor is

operative to process the frequency-domain data to detect decode components of the identification

code at predetermined frequencies.

104. (Currently Amended) A system for measuring usage of media data received at a

user location, comprising:

a monitoring device at the user location and having an input to receive media data

representing information;

a first processor at the user location coupled with the monitoring device to receive

the media data and operative to form a data set representing some, but not all, of the information

represented by the media data;

a first communications device coupled with the first processor to receive the data

set and operative to communicate the data set to a processing system located remotely from the

user location;

a second communications device at the processing system coupled with the first

communications device to receive the data set; and

Art Unit: 2617

a second processor at the processing system and having an input coupled with the

second communications device to receive the data set received by the second communications

device, the second processor being operative to carry out at least one of:

(a) processing the data set to detect decode an ancillary code for the media

data; and

(b) obtaining identification data for the media data by producing a signature

for the media data based on the data set and matching the produced signature with a reference

signature associated with the identification data.

105. (Original) The system of Claim 104, wherein the first processor is operative

to form the data set by transforming at least a portion of the received media data into frequency-

domain data.

106. (Original) The system of Claim 105, wherein the first processor is operative

to form the data set by producing amplitude data for each of a plurality of frequency ranges of

the frequency-domain data, each frequency range corresponding to a predetermined component

of the identification code.

107. (Original) The system of Claim 106, wherein the first processor is operative

to form each of the amplitude data as a ratio of amplitude data in a corresponding frequency

range to a noise level based on amplitude data outside such corresponding frequency range.

108. (Original) The system of Claim 104, wherein the monitoring device

comprises a portable monitoring device carryable on the person of a user.

109. (Currently Amended) The system of Claim 104, wherein the second processor is

operative to detect decode the identification code by processing frequency-domain data.

Art Unit: 2617

110. (Currently Amended) The system of Claim 109, wherein the second processor is operative to process the frequency-domain data to detect decode components of the identification code at predetermined frequencies.

111. (Currently Amended) A method for measuring usage of media data received at a user location, the media data being reproducible as comprehensible images or comprehensible sounds, comprising:

receiving a data set at a processing system located remotely from the user location, the data set including data sufficient to decode ancillary codes if present in the media data or to form a signature to identify the media data, while excluding data required either to reproduce the comprehensible images or the comprehensible sounds; and

at the remotely located processing system:

processing the data set to detect decode the ancillary codes if present in the data set, and

if ancillary codes are not detected in the data set, producing a signature characterizing the media data and matching the produced signature with a reference signature associated with identification data for the media data.

- 112. (Previously presented) The method according to Claim 111, further comprising: receiving the media data in a monitoring device at the user location; forming the data set in the monitoring device from the media data; and communicating the data set from the user location to the remotely located processing system.
- 113. (Previously presented) The method according to Claim 112, wherein forming the data set comprises transforming at least a portion of the received media data into frequency-domain data.

Art Unit: 2617

114. (Previously presented) The method according to Claim 112, wherein the data set

comprises data representing time-domain information.

115. (Previously presented) The method according to Claim 114, wherein the time-

domain data comprises data from a frequency range narrower than a frequency range of the

media data.

116. (Previously presented) The method according to Claim 112, wherein the data set

comprises data representing phase information.

117. (Previously presented) The method according to Claim 112, wherein the media

data comprises audio data or video data.

118. (Previously presented) The method according to Claim 112, wherein the media

data is received as acoustic energy, electromagnetic energy, light energy, magnetic energy, or

electrical energy.

119. (Previously presented) The method according to Claim 112, wherein receiving

media data comprises receiving media data in a portable monitoring device carryable on the

person of a user.

120. (Currently Amended) A system for measuring usage of media data received at a

user location, the media data being reproducible as comprehensible images or comprehensible

sounds, comprising:

a processing system located remotely from the user location for receiving a data

set, the data set including data sufficient to decode ancillary codes if present in the media

data or to form a signature characterizing the media data, while excluding data required

to reproduce the comprehensible images or the comprehensible sounds;

the remotely located processing system operative to process the data set to detect

decode the ancillary codes if present in the data set;

the remotely located processing system operative to, if ancillary codes are not

detected in the data set, produce a signature characterizing the media data and matching

Art Unit: 2617

the produced signature with a reference signature associated with identification data for the media data.

121. (Previously presented) The system of Claim 120, further comprising:

a receiver operative to receive the media data at the user location;

a processor at the user location operative to form the data set from the media data;

and

a communication device operative to communicate the data set from the user location to the remotely located processing system.

- 122. (Previously presented) The system of Claim 121, wherein the processor is operative to transform at least a portion of the received media data into frequency-domain data.
- 123. (Previously presented) The system of Claim 121, wherein the processor is operative to form the data set including data representing time-domain information therein.
- 124. (Previously presented) The system of Claim 123, wherein the processor is operative to select the time-domain data from a frequency range narrower than a frequency range of the media data.
- 125. (Previously presented) The system of Claim 121, wherein the processor is operative to form the data set including data representing phase information therein.
- 126. (Previously presented) The system of Claim 121, wherein the receiver is operative to receive the media data as acoustic energy, electromagnetic energy, light energy, magnetic energy, or electrical energy.
